

ZEDnet

The central ZEDnet software solution is the perfect addition to optimize the management of ZED devices. All programs and associated parameters are stored centrally on the server and distributed to the connected devices when needed. This can be particularly useful when multiple identical devices with the same measuring programs are used.

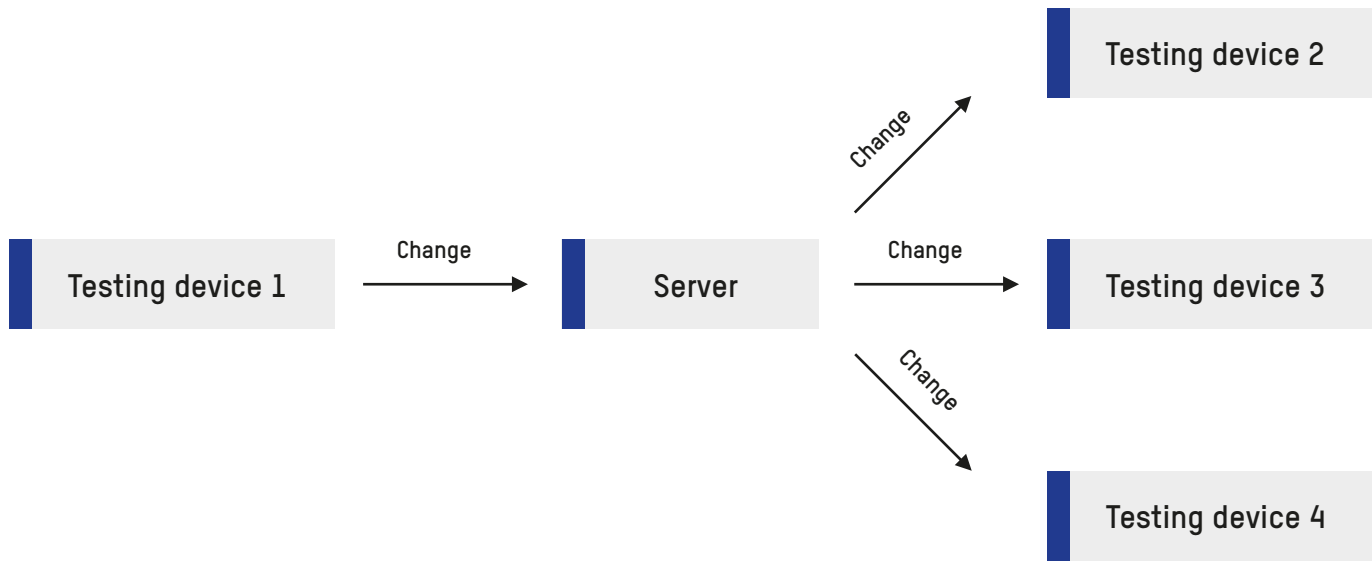

Advantages:

- + Central management of parameters
- + Minimal effort when changing the test program
- + Overview of all connected ZED devices

Application examples:

- If multiple devices are used at the same or different locations which are running the same measuring programs, it can be challenging to keep changes in sync.
- When you use ZEDnet, it is no longer necessary to make the desired changes locally on each individual device. Instead, only one connected device is changed. The changes are automatically applied to the other devices that are also using this program.

Example of server / testing device environment:

Product features:

- Automated backups of the database
- Central backup of parameters
- High data security
- Automatic notification of ZED devices when parameters change

System requirements (operating system):

- Windows 7, 10, Server 2008 or later (64-bit)
- Microsoft .NET Framework 4.5.2 or later
- Microsoft SQL Server 2012 (64-bit) or later (not included with license)

Hardware connection:

- Ethernet connection based on TCP/ IP to the leak testing devices

Compatible with all devices of the ZED family

0919 en Subject to error, misprints or alteration for reasons of technological advancement.
